This invention describes milk-derived bifidogenic peptides and their active derivatives or fragments, and combinations of them produced by chemical coupling. Such are produced from bovine or human milk by treatment for 2 hr with proteases, then centrifuging to remove fat and aciditying to pH 2 to precipitate proteins. The solution phase is then subjected to reverse-phase high-performance liquid chromatography (HPLC) and cation-exchange HPLC, the fractions adjusted to salt content below 25 mM (by dialysis or reverse-phase HPLC) and tested for activity by growing Bifidobacterium bifidus and Escherichia coll in presence of the fractions. Those fractions for which (Bw-BD)-(Ew-ED) is at least 0.15 are selected where Bw = germ count after 16 hr culture of E. coll in 3 g/l tryptic broth containing peptide at 0.2 mg/ml, BD = germ count under similar conditions in a peptide-free control, Ew = germ count after 16 hr culture of E. coll in 3 g/l tryptic broth containing peptide at 0.2 mg/ml, ED = germ count under similar conditions in a peptide-free control. The peptides Aww3865-w3888 are used to treat microbe-related diseases caused by bacteria, fungi, yeast, protozoa, viruses, mycoplasma, filaria and plasmodla, e.g. infections, inflammation, microbially induced tumours or degenerative disorders, diarrhoea, colic, abnormalities in oral, intestinal or vaginal microflora, or caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             endotoxin neutralisation; Gram negative bacterium; lipopolysaccharide;

                                                                                          The invention relates to proteolytic fragments of lactoferrin (LF) and variants thereof which act as host-defence peptides, having antimicrobial and endotoxin-neutralising activity. The peptides are useful for treatment of bacterial and fungal infections, and may be particularly used for treating sepsis, tuberculosis and leprosy. The peptides are also useful for treating a variety of products at risk of contamination with microorganisms and endotoxin (lipopolysaccharide, LPS), such as food products, tissue, living cells, blood, drugs, glassware and surgical equipment. Sequences AAB22817 and AAB2282-B22827 represent specifically claimed human lactoferrin derived polypeptides of the invention. The present sequence is a 6 kD fragment of human lactoferrin comprising the N-terminal 51 residues produced via cathepsin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or may residue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              or may residue.
proteolytic digestion of lactoferrin, useful for treatment of bacterial and fungal infections, and for preventing contamination of e.g. food products, living cells, and blood -
                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "each Cys residue may be in reduced form
form a disulphide bond with another Cys
A 10-46 disulphide bond is exemplified"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
effect against viral infection. The peptides are derived from lactoferrin. Their activity is demonstrated against cytomegalovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           peptide(s) derived from human lactoferrin - are useful as
uno:activators, esp. for preventing infection by cytomegalovirus
                                                                                                                                                                                                                                                                                                             lmmunoactivator; antiviral; cytomegalovirus; cosmetic; food; feed;
lymphocyte blastogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is one of four new peptides (see AAR91191 - AAR91193) obtained by enzymatically decomposing lactoferrin using procease. The peptides are immunoactivators which induce blastogenesis of lymphocytes and are particularly useful for treating cytomegalovirus infection. They can be used in drugs and cosmetics and can be added to foods and feeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                        10..46 /note= "optionally this bond may be reduced" 20..37 /note= "optionally this bond may be reduced"

The sequence represents the human lactoferrin (hLF) protein variant hLF-2N. The invention relates to novel methods of treatment using high doses of lactoferrin. The methods of the invention are useful for the treatment or prophylaxis of infectious diseases, inflammatory diseases and excess of heparin e.g. gastroenteritis, inflammatory bowel disease, sepsis, anaemia, myelopoieses, reducing reperfusion injury, cytokine release and proteoglycan-mediated entry of virus into cells. The advantage of the method is that the patient is substantially free of side effect responses to administration of lactoferrin. Therefore large doses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of lactoferrin can be administered. Note: The present sequence is not shown in the specification but is derived from human wild-type lactoferrin sequence given in the sequence
                                                                                                                                                                                                                                                                                                                         treatment of infectious diseases, inflammatory heparin

Pref. examples of amino acid sequences contg. the above peptide are given in AAR88217/18. The regulatory sequence is the tac promoter from shuttle vector pSEZ2, the GALI promoter from vector pKOM2 or Rous Sarcoma Virus long terminal repeat from vector pRSVNot.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                          The invention relates to improved feed for production animals, comprising one or more plant-derived feed ingredients, substantially unsupplemented with small-molecule antibiotics and as an additive a seed composition containing a flour, extract or malt obtained from mature monocot seeds and one or more heterologous seed-produced antimicrobial proteins in substantially unpurified form. The invention is useful as a feed for production animals such as poultry and hoofed farm animals. The present sequence is human codon optimised lactoferrin. This sequence is used in the invention.
                                                                                                                                               Improved feed for production animals, comprising plant-derived feed ingredients, and seed composition containing flour, extract, or malt from mature monocot seeds and heterologous seed-produced anti-microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Transformed plant; heterologous transcription factor; transgenic plant; seed protein; protein expression.

The invention describes a method of producing a heterologous polypeptide

(1) in a grain of a plant, comprising culturing a transformed plant (P1) comprising a first chimer; gene, and optionally, at least one heterologous transcription factor that is capable of enhancing the expression of the chimeric gene, to form a grain producing transforming plant (P2), and recovering transgenic grains containing (I) from P2.

The method is useful for producing heterologous polypeptide in a grain of a plant. (I) is a non-plant storage, human or non-human animal, milk or other than a milk polypeptide, antibodies, cytokines, lymphokines, con other than a milk polypeptide, antibodies, cytokines, lymphokines, anti-infectives, or cytotoxins, or anti-inflammatory molecule or intestinal trafoll factor (TFF) or its active fragment. Preferably, (I) is lactoferrin, lysozyme, lactoferricin, ITF, epidermal growth factor (GGF), keratinocyte growth factor (KGF), insulin-like growth factor (GGF), heratinocyte growth factor (KGF), insulin-like growth factor (GGF), beta-lactoglobulin, alpha-casein, haptocorrin, lactoperoxidase, alpha-l-antitrypsin, immunoglobulins, alpha-lactalbumin, fibrinogen or protesse inhibitor. This is the anino acid sequence of a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthetic polynucleotide encoding human lactoferrin, used for production of functional foods, vegetal milks and human lactoferrin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of human lactoferrin. The invention relates to a synthetic gene (see AAZ58122) that encodes human lactoferrin but which has codon usage designed to maximise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 690;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3 RRRSVQWCAVSQPEATKCFQWQRNMRKVRGPPVSCIKRDSPIQCIQA 49

          lactoferrin in a tissue-specific manner, especially in the seeds, can be used in processes for the production of functional vegetal milk, fruit juices, fruit and/or vegetable homogenized foods (claimed). The transgenic plants are selected from solanaceae, cereals, leguminosae, fruit bearing plants and horticultural plants, especially soybean, tobacco and rice.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   human lactoferrin his protein (represented by the present sequence).

N-terminal his peptides have antimicrobial activity. The peptides of the invention are used to treat microbial infections, especially infections by gram positive or negative bacteria, particularly listeria, staphylococcus, Riebsiella or Escherichia species, especially infections in monocytogenes, a ureus and E. coli. Other uses include reducing inflammatory response by neutralising heparin or Ilpopolysaccharide or by reducing cytokine production and neutrophil degranulation, inhibiting entry of viruses such as cytomegalovirus, herpes simplex virus 1 or HIV into cells, inhibiting myelopolesis and reducing production of GM-CSF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptides comprising the N-terminal region of human lactoferrin protein exhibit higher antimicrobial activity than the full length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a nutritionally enhanced food comprising one or more plant-derived food ingredients, and as an additive, a seed composition containing a flour, extract, or malt obtained from mature monocot seeds and one or more seed-produced human milk proteins in additive compositions are useful for improving infant formula. Infant formulas containing the recombinant human milk proteins are useful in supplementing or enhancing the diet of infants, particularly very low birth weight infants. The present sequence is human codon optimised lactoferrin.

A Clonetech cDNA library from normal human breast tissue (will was plated in host cells 71090, filter-lifted and probed with mouse lactoferrin cDNA 7267. Positive clones were plaque-purified and the lactoferrin cDNA 7267. Positive clones were plaque-purified and the crescambinant clones were transformed into XLI Blue cells. The recombinant clones were transformed into XLI Blue cells. The longest insert (HLF 1212) was sequenced and was 2117bp in length. The amino acid sequence coded for by HLF 1212 has 4 sites that differ from the previously published revised amino acid sequence cells from the protein (B.F.Anderson et al., J.Mol.BHOL. 209: 711-734, 1989). Also contained within HLF 1212, but not in any of the other partially sequenced isolates, is a deleted cytosine at C bp 2097 (AA 699) which caused a frameshift at the 3' end of the coding CC sequence. The deletion is thought to be either a cloning artefact or a rare species of mRNA. See also AAQ23454 and AAQ23455.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or a rare species of mRNA. IS-08-464-182A-2
Sequence 2, Application US/08464182A
Patent No. 5849885
GENERAL INFORMATION:
APPLICANT: Nuijens, Jan H.
APPLICANT: Van Veen, Harry H.
TITLE OF INVENTION: Isolation of Lactoferrin from Milk
CORRESPONDENCE ADDRESS:
ADDRESSEE: TOWNSEND and TOWNSEND and CREW LIP
STREET: Two Embarcadero Center, 8th Floor
CITY: San Francisco
STATE: CA
COUNTRY: USA
ZIP: 94111
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SORTWARE: Datentin Release #1 0 Vorsion #1 20

Release #1.0, Version #1.30 CIASSIFICATION: 530
PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 08/198,321
FILING DATE: 16-FEB-1994
ATTORNEY/AGENT INFORMATION:
NAME: Apple, Randolph T.
REGISTRATION NUMBER: 36,429
REFERENCE/DOCKET NUMBER: 06994-004920US
TELECOMMUNICATION INFORMATION: UMBER: US/08/464,182A 05-JUN-1995 FILING DATE: 530
CLASSIFICATION: 530
PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 08/406,271
FILING DATE: 09-MAR-1995 TELEPHONE (650) 326-2400
TELEPAX: (650) 326-2422
TELEPAX: (650) 326-2422
INFORMATION FOR SEQ ID NO: 2:
SEQUENCE CHARACTERISTICS:
LENGTH: 54 amino acids
TYPE: amino acids
STRANDEDNESS: not relevant
TOPOLOGY: not relevant
MOLECULE TYPE: peptide
FEATURE: SOFTWARE: Patentin Re CURRENT APPLICATION DATA APPLICATION NUMBER: U FILING DATE: 05-JUN-1

NAME/KEY: Peptide LOCATION: 1..54 OTHER INFORMATION: /note= "HLF cDNA of GPE"

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C -!- FUNCTION: TRANSFERRINS ARE IRON BINDING TRANSPORT PROTEINS WHICH CAN BIND TWO ATOMS OF FERRIC IRON IN ASSOCIATION WITH THE BINDING CC OF AN ANTON, USUALLY BICARBONATE.

C -!- FUNCTION: LACTOFERROXINS A, B AND C HAVE OPIOID ANTAGONIST ACTIVITY. LACTOFERROXINS A, B AND C HAVE SOMEWHAT HIGHER DEGREES OF PREFERENCE CC FOR KAPPA-RECEPTORS. THAN FOR MU-RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE-91166929; PubMed-1369293;

Blochem. Blophys. Res. Commun. 203:1314-1332(1994).
-!- FUNCTION: TRANSFERRINS ARE IRON BINDING TRANSPORT PROTEINS WHICH OA BIND TWO ATOMS OF FERRIC IRON IN ASSOCIATION WITH THE BINDING OF AN ANION, USUBALLY BICARRENDATE.
-!- SUBGELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Secreted.
-!- DOMAIN: COMPOSED OF TWO HOMOLOGOUS DOMAINS.
-!- SIMILARITY: BELONGS TO THE TRANSFERRIN FAMILY.
                                                                                                                                                                          Capra hircus (Goat).

"Nucleotide sequence of porcine liver transferrin.";

Nucleic Acids Res. 16:8720-8720(1988).

!- FUNCTION: TRANSFERRINS ARE IRON BINDING TRANSPORT PROTEINS WHICH
CAN BIND TWO ATOMS OF FERRIC IRON IN ASSOCIATION WITH THE BINDING
OF AN ANION, USBALLY BICARBONATE. IT IS RESPONSIBLE FOR THE
TRANSPORT OF IRON FROM STIES OF ABSORPTION AND HEME DEGRADATION
TO THOSE OF STORAGE AND UTILIZATION. SERUM TRANSFERRIN MAY ALSO
HAVE A FURTHER ROLE IN STIMULATING CELL PROLIFERATION.
                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-MAR-1989 (Rel. 10, Created)

BIOL. Chem. 271:1166-1173(1996).

-1 FUNCTION: TRANSFERRINS ARE IRON BINDING TRANSPORT PROTEINS WHICH CAN BIND TWO ATOMS OF FEREIC IRON IN ASSOCIATION WITH THE BINDING OF AN ANION, USUALLY BICARBONATE. IT IS RESPONSIBLE FOR THE TRANSPORT OF IRON FROM SITES OF ABSORPTION AND HEME DEGRADATION TO THOSE OF STORAGE AND OTILIZATION. SERUM TRANSFERRIN MAY ALSO HAVE A FURTHER ROLE IN STIMULAFING CELL PROLIFERATION.
-1 SUBJUNIT: MONOMER (By similarity).
-1 SUBCELLUTAR LOCATION: Secreted.
-1 ILSSUE SPECIFICITY: Expressed in liver; secreted in plasma.
-1 DOMAIN: COMPOSED OF TWO HOMOLOGOUS DOMAINS.
-1 SIMILARITY: BELONGS TO THE TRANSFERRIN FAMILY.
                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                            01-NOV-1997 (Rel. 35, Created)

SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: Expressed in liver; secreted in plasma.
DOMAIN: COMPOSED OF TWO HONOLOGOUS DOMAINS.
SIMILARITY: BELONGS TO THE TRANSFERRIN FAMILY.
                                                                                                                                                                                                                                                    Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-! FUNCTION: TRANSFERRINS ARE IRON BINDING TRANSPORT PROTEINS WHICH
CAN BIND TWO ATOMS OF FERRIC IRON IN ASSOCIATION WITH THE BINDING
OF AN ANION, USUALLY BICARBONATE (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE TRANSFERRIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
